

AI won't replace you. Only its **smarter users** will.

Can your organization actually identify its smart AI users?

The real AI advantage doesn't come from the tools you buy. It comes from knowing who can use them to create impact.

The investment in AI is staggering. The visibility into who can deliver?

Close to zero. How many of your employees actually have real

AI competency, rather than just claim it? This lack of visibility is a massive bottleneck. **Right now, most companies are guessing.**

We help you start knowing.

GUESSING → **KNOWING**

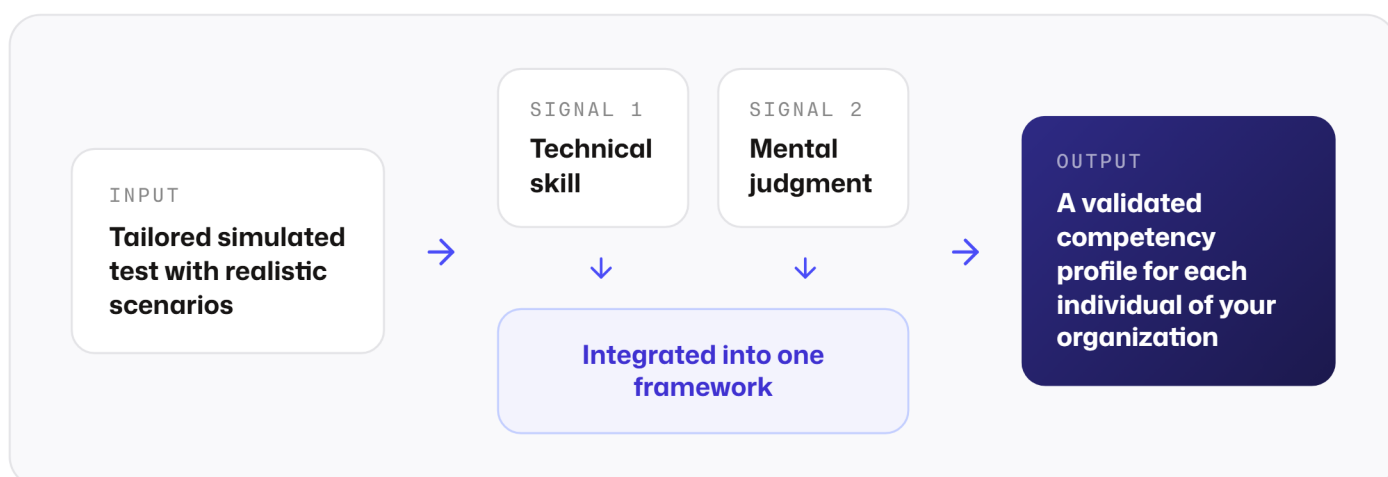

01 THE PROBLEM

Companies often fail to verify their readiness or close the skill gaps necessary for successful adoption. Employers need teams that can collaborate fluently with AI, evaluate its outputs and adapt in real time. Yet, most can't actually demonstrate these skills.

- ◆ Self-claimed, not proven skills which don't show smart AI users
- ◆ Almost no one verifies critical thinking or whether AI outputs can be trusted
- ◆ Most AI-readiness assessments are unscientific and unvalidated checklists
- ◆ Most tools only test basic Gen-AI use, missing the future of intelligent machines

02 HOW WE VERIFY IT

We combine **technical skills** verification with the **mental judgment** to steer AI, integrated into one validated framework and re-evaluated over time.

03 WHY OURS IS DIFFERENT

We verify if your people can create value with AI in the work they actually do **before** you invest in the technology. Four deliberate breaks from how the market tests today:

Measured in one task

We verify **technical skills** and **mental judgment** at the same time in a single, realistic scenario, reflecting what your team can actually do on the job.

Built on scientific rigor

We use **scientifically validated assessments** and **human-in-the-loop** review to verify how your team actually performs with AI in a workplace.

Tailored to your context

We built **scenarios around your company**: roles, workflows and real use cases, so results reflect readiness for your work, not a generic benchmark.

Designed to last

We measure the underlying competency that **stay relevant** as AI rapidly evolves, rather than testing for specific tools or trends that fade in months.

04 WHAT YOU GET

Data-driven, not assumption-driven, visibility into where your people are today, who will perform, which skill gaps to close first, and who needs upskilling or reskilling. A **decision-ready competency profile** on a five-level behavioral scale showing exactly what to do next.

Poor

The required competency is missing or consistently below standard.

Limited

The competency shows up unevenly, with frequent gaps.

Adequate

The competency is present at a consistent, baseline level.

Strong

The competency is demonstrated reliably and to clear effect, above expectations.

Excellent

The competency is exemplary and consistently above the expected standard.

Ready to identify your smart AI users?

Get more value from your AI technology investments and avoid mistakes.
